

EXPLANATION OF DIRECTORY STRUCTURE

The directory structure in all projects is inspired by this post (<https://towardsdatascience.com/how-to-keep-your-research-projects-organized-part-1-folder-structure-10bd56034d3a>) and will have a utilities folder which will include the subdirectories of compute, data, and plot; there will be a data folder which will contain locally necessary files - typically these will be symbolic links to data directories elsewhere on the server. In general these data files should not be manipulated, or if they are those manipulations should be documented. there will be an Pipeline folder, which will contain a folder for every script written 2 folders - one for processed data and one for plots; there will be a tests folder, which will contain necessary unit tests, and there will be a docs folder which will contain project explanations such as this document.
